

Answer:

```

Work Area
using Microsoft.IdentityModel.Claims;

public class IdentityClaim
{
    private string _identityProvider;
    private string _identityValue;
    public const string ACSProviderClaim =
        "http://schemas.microsoft.com/accesscontrolservice/...";

    public IdentityClaim( identity)
    {
        if (identity != null)
        {
            foreach (var claim in identity.Claims)
            {
                _identityValue = claim.Value;
            }
            if (claim == ACSProviderClaim)
            {
                _identityProvider = claim.Value;
            }
        }
    }
}
    
```

QUESTION 125 Drag and Drop Question You are developing an ASP.NET MVC application that allows users to log on by using a third-party authenticator. You need to configure Microsoft Azure Access Control Services and the application. Which five actions should you perform in sequence? (To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.)

Actions	Answer Area
Add a symmetric key service identity.	
Register the application as the relying party.	
Generate provider rules for claims.	
Add a Security Token Service (STS) reference in Visual Studio 2012.	
Add the third-party as the identity provider.	

Answer:

Actions	Answer Area
Add a symmetric key service identity.	Create a service namespace.
Register the application as the relying party.	Add the third-party as the identity provider.
Generate provider rules for claims.	Register the application as the relying party.
Add a Security Token Service (STS) reference in Visual Studio 2012.	Generate provider rules for claims.
Add the third-party as the identity provider.	Add a Security Token Service (STS) reference in Visual Studio 2012.

QUESTION 126 You are developing an ASP.NET MVC application. The application has a contact view that includes a form for editing the displayed contact. You need to save the Contact type when the form is posted back to the EditContact method. Which code segment should you use? (Each correct answer presents a complete solution. Choose all that apply.)

```

 A. public ActionResult EditContact(QueryStringValueProvider values)
    {
        var c = new Contact()
        {
            FirstName = values.GetValue["FirstName"],
            LastName = values.GetValue["LastName"]
        };
        SaveContact(c);
        return View(c);
    }

 B. public ActionResult EditContact()
    {
        var c = new Contact()
        {
            FirstName = Request.QueryString["FirstName"],
            LastName = Request.QueryString["LastName"]
        };
        SaveContact(c);
        return View(c);
    }

 C. public ActionResult EditContact(Contact c)
    {
        SaveContact(c);
        return View(c);
    }

 D. public ActionResult EditContact(FormCollection values)
    {
        var c = new Contact()
        {
            FirstName = values["FirstName"],
            LastName = values["LastName"]
        };
        SaveContact(c);
        return View(c);
    }

```

A. Option AB. Option BC. Option CD. Option D Answer: BCDE Explanation: Basics of RESTful services: REST stands for Representational State Transfer, it is a simple stateless architecture that runs over HTTP where each unique URL is representation of some resource. There are four basic design principles which should be followed when creating RESTful service:- Use HTTP methods (verbs) explicitly and in consistent way to interact with resources (Uniform Interface), i.e. to retrieve a resource use GET, to create a resource use POST, to update a resource use PUT/PATCH, and to remove a resource use DELETE. Etc. QUESTION 127 You are developing an ASP.NET MVC application that uses forms authentication. Authentication credentials must be encrypted and secure. You need to ensure that user credentials are persisted after users log on. Where should you store the credentials? (Each correct answer presents a complete solution. Choose all that apply.) A. In TempData B. In Session C. In ViewData D. In a cookie Answer: BD QUESTION 128 You are developing an ASP.NET MVC application to be used on the Internet. The environment uses Active Directory with delegation to access secure resources. Users must be able to log on to the application to maintain their personal preferences. You need to use the least amount of development effort to enable users to log on. What should you do? A. Enable Windows authentication. B. Generate server SSL certificates and install them in IIS. C. Enable Digest authentication. D. Enable Forms authentication. Answer: A Explanation: Requirements for Delegation Delegation relies on Integrated Windows authentication to access resources. There is no limit on the number of computers that you can delegate your account -- you must correctly configure each of them. The Integrated Windows authentication method works only if the following two conditions exist:/ You set up your network to use the Kerberos authentication protocol that requires Active Directory./ You set up the computers and accounts on your network as trusted for delegation. QUESTION 129 You are desinging a distributed application. The application must store secure information that is specific to an individual user. The data must be automatically purged when the user logs off. You need to save transient information in a secure data store. Which data store should you use? A. profile properties B. session state C. database storage D. application state Answer: D Explanation: Use ASP.NET session state to store and retrieve values for a user. Secure Session-State Configuration When storing sensitive information in a configuration file for an application, you should encrypt the sensitive values using Protected Configuration. Information that is especially sensitive includes the encryption keys stored in the machine Key configuration element and data source connection strings stored in the connection Strings configuration element. QUESTION 130 You are developing an application. One requirement is that part of your data access layer needs to be available to a third party, that wants to get this information from a REST URL in XML. Your company does not have experience with web services, but you have several websites running ASP.NET MVC 4. How could you design and provide these new services? (Choose all that apply.) A. Task an individual on staff to learn WCF, and have this individual develop and deploy these new services using WCF. B. Use the Web API to create REST services using ApiController in which the serialization type is defined by the Accepts property of the browser. C. Build a basic ASP.NET MVC 4 project in which the view simply passes through the information provided by the controller, and the controller manages the code for serializing the response. D. Create an ASP.NET ASMX services file to get, serialize, and return the data. Answer: BC Braindump2go Promises All our customers: 100% All Exams Pass Or Full Money Back! Our experts have compiled the fail proof 70-486 Exam content to help all candidates pass your 70-486

certification exam easily in the first attempt and score the top possible grades too. Do you want to succeed? Come to Braindump2go and our experts team will tell you what you need to do! 70-486 Exam Dumps Full Version Download:
