(Choose three) A. asynchronous balanced mode (ABM)B. normal response mode (NRM)C. normal peer mode (NPM)D. asynchronous client mode (ACM)E. asynchronous response mode (ARM) Answer: ABE Explanation: Asynchronous response mode is an HDLC addition[1] for use over full-duplex links. While retaining the primary/secondary distinction, it allows the secondary to transmit at any time. Asynchronous balanced mode added the concept of a combined terminal which can act as both a primary and a secondary. There are some subtleties about this mode of operation; while many features of the protocol do not care whether they are in a command or response frame, some do, and the address field of a received frame must be examined to determine whether it contains a command (the address received is ours) or a response (the address received is that of the other terminal).
