Each question in the series contains a unique solution. Determine whether the solution meets the stated goals. A company has an e-commerce website. When a customer places an order, information about the transaction is inserted into tables in a Microsoft SQL Server relational database named OLTP1. The company has a SQL Server Analysis Services (SSAS) instance that is configured to use Tabular mode. SSAS uses data from OLTP1 to populate a data model.Sales analysts build reports based on the SSAS model. Reports must be able to access data as soon as it is available in the relational database.You need to configure and deploy an Analysis Services project to the Analysis Services instance that allows near real-time data source access.Solution: In the Deployment Option property for the report, you set the Query Mode to InMemory with DirectQuery.Does the solution meet the goal? A. YesB. No Answer: BExplanation:With In Memory with DirectQuery: Queries use the cache by default, unless otherwise specified in the connection string from the client.

https://msdn.microsoft.com/en-us/library/hh230898(v=sql.120).aspx QUESTION 18Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution. Determine whether the solution meets the stated goals. You have an existing multidimensional cube that provides sales analysis. The users can slice by date, product, location, customer, and employee. The management team plans to evaluate sales employee performance relative to sales targets. You identify the following metrics for employees: You need to implement the KPI based on the Status expression. Solution: You design the following solution: Does the solution meet the goal? A. YesB. No Answer: A QUESTION 19Note: This question is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series. Information and details provided in a question apply only to that question. You have a Microsoft SQL Server Analysis Services (SSAS) instance that is configured to use multidimensional mode. You create the following cube: You need to create a new dimension that allows users to list shipments by the country where the product is shipped. Which relationship type should you use between the Shipment table and the new dimension? A. no relationship B. regularC. factD. referencedE. many-to-manyF. data mining Answer: EExplanation: Many to Many Dimension Relationships. In most dimensions, each fact joins to one and only one dimension member, and a single dimension member can be associated with multiple facts. In relational database terminology, this is referred to as a one-to-many relationship. However, it is frequently useful to join a single fact to multiple dimension members. For example, a bank customer might have multiple accounts (checking, saving, credit card, and investment accounts), and an account can also have joint or multiple owners. The Customer dimension constructed from such relationships would then have multiple members that relate to a single account transaction. https://docs.microsoft.com/en-us/sql/analysis-services/multidimensional-models-olap-logical-cube-objects/dimension-relationships QUESTION 20Hotspot QuestionYou are deploying a multidimensional Microsoft SQL Server Analysis Services (SSAS) project. You add two new role-playing dimensions named Picker and Salesperson to the cube. Both of the cube dimensions are based upon the underlying dimension named Employee in the data source view. Users report that they are unable to differentiate the Salesperson attributes from the Picker attributes. You need to ensure that the Salesperson and Picker attributes in each dimension use unique names. In the table below, identify an option that you would use as part of the process to alter the names of the attributes for each of the dimensions. NOTE: Make only one selection in each column. Answer: Explanation: A named query is a SQL expression represented as a table. In a named query, you can specify an SQL expression to select rows and columns returned from one or more tables in one or more data sources. A named query is like any other table in a data source view (DSV) with rows and relationships, except that the named query is based on an expression. A named query lets you extend the relational schema of existing tables in DSV without modifying the underlying data source.

https://docs.microsoft.com/en-us/sql/analysis-services/multidimensional-models/define-named-queries-in-a-data-source-view-analys is-services QUESTION 21You are building a Microsoft SQL Server Analysis Services multidimensional model over a SQL Server database. In a cube named OrderAnalysis, there is a standard cube dimension named Stock Item. This dimension has the following attributes:Users report that the attributes Stock Item Key and Photo are distracting and are not providing any value. They have asked for the attributes to be removed. However, these attributes are needed by other cubes. You need to hide the specified attributes from the end users of the OrderAnalysis cube. You do not want to change the structure of the dimension. Which change should you make to the properties for the Stock Item Key and Photo attributes? A. Set the AttributeHierarchyVisible property to False.B. Set the AttributeHierarchyEnabledproperty to False.C. Set the AttributeVisibility property to Hidden.D. Set the Usage property to Regular.E. Set the AttributeHierarchyDisplayFolder property to Hidden. Answer: AExplanation:The value of the AttributeHierarchyEnabled property determines whether an attribute hierarchy is created. If this property is set to False, the attribute hierarchy is not created and the attribute hierarchy can still be used to order the members of another attribute. If the value of the AttributeHierarchyEnabled property is set to True, the value of the AttributeHierarchyVisible property determines whether the attributeHierarchyVisible independent of its use in a user-defined hierarchy.

https://technet.microsoft.com/en-us/library/ms166717(v=sql.110).aspx QUESTION 22You are optimizing a Microsoft SQL Server Analysis Services (SSAS) multidimensional model over a SQL Server database. You have a table named City which has several dimensions that do not contain a space in their names. One dimension is named SalesTerritory rather than Sales Territory. You need to ensure that Report developers can drag the attribute name to the report rather than having to re-label the attributes by implementing spaces. You must minimize administrative effort and not break any upstream processes. What should you do? A. In the SQL Server database, run the system procedure sp\_rename to rename the columns in the base tables with the target name.B. In SQL Server Management Studio, navigate to the City table, expand the columns, press F2, and rename the columns in the base tables.C. In the SQL Server database, implement a SYNONYM.D. In the SQL Server database, implement a view over the City table that aliases the columns in the tables. Answer: D QUESTION 23Note: This question is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series. Information and details provided in a question apply only to that question. You administer a Microsoft SQL Server Analysis Services (SSAS) tabular model for a travel agency that specializes in vacation packages. Vacation bookings and packages are stored in a SQL Server database. You use the model as the basis for customer emails that highlight vacation packages that are currently underbooked, or projected to be underbooked. The company plans to incorporate cruise ship vacation packages. Cruise ship vacation packages include new features such as region availability and cruise line specialties that require changes to the tabular model. You must ensure that the tabular model reflects the new vacation packages. You need to configure the tabular data model.What should you do? A. Ensure that DirectQuery is enabled for the model.B. Ensure that DirectQuery is disabled for the model.C. Ensure that the Transactional Deployment property is set to True.D. Ensure that the Transactional Deployment property is set to False.E. Process the model in Process Full mode.F. Process the model in Process Data mode.G. Process the model in Process Defrag mode. Answer: EExplanation: Process Full processes an Analysis Services object and all the objects that it contains. When Process Full is executed against an object that has already been processed. Analysis Services drops all data in the object, and then processes the object. This kind of processing is required when a structural change has been made to an object, for example, when an attribute hierarchy is added, deleted, or renamed. !!!RECOMMEND!!! 1./2017 New Version 70-768 Exam Dumps (PDF & VCE) 40Q&As Download:http://www.braindump2go.com/70-768.html 2.|2017 New Version 70-768 Study Guide Video: YouTube Video: YouTube.com/watch?v=-KN7DASNvQQ
